

## HEAVY DUTY PANIC ESCAPE LOCKS

Upright cylinder mortice lock cases, for use with 17mm Euro-profile cylinders. For timber, aluminium or steel doors.

Heavy stainless steel forend and lipped strike plate, galvanised steel case. Nickel plated steel latch and deadbolts. 9mm follower to accept "Split" spindle unsprung furniture, at 72mm centres. The lock may be used with lever furniture on both sides, Hewi push/pull handles or push handle and lever combinations, or suitable panic bar and lever combinations.

### FUNCTION:

The lock has three separate states of operation;

**State one:** Fully unlocked, the door is held closed by the latchbolt only, which may be freely operated by the lever furniture from either side.

**State two:** A single rotation of the key, from either side of the door, will "Disengage" the external furniture, the internal furniture continues to operate. In this state the door may be used to leave the building but the door will self lock as it closes.

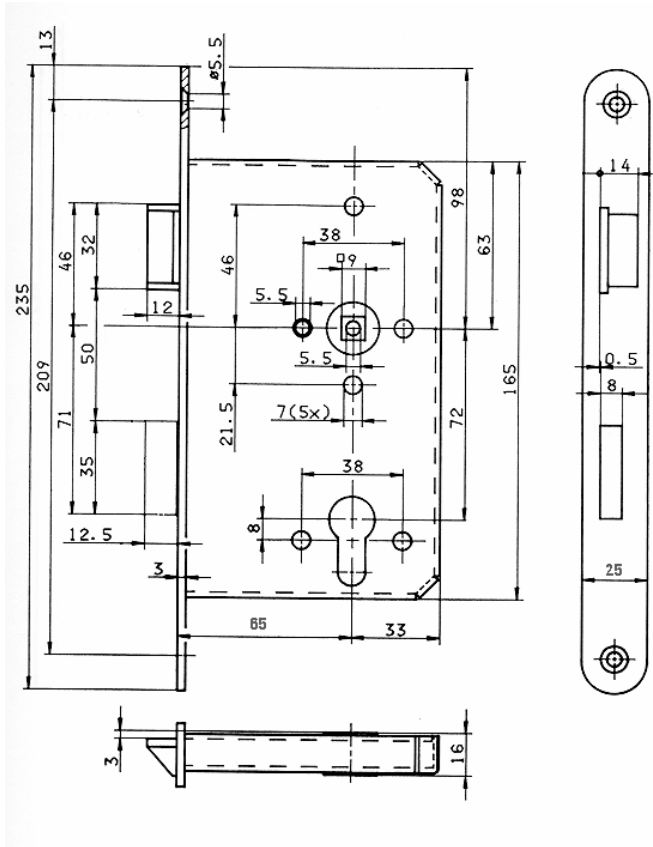

**State three:** A second rotation of the key will throw the deadbolt for additional security. The external furniture remains inoperable, the internal furniture will operate to withdraw BOTH latch and deadbolts simultaneously. Once the furniture has been operated to give emergency escape, from the fully locked state, the lock will revert to "state two".

To return the lock to the fully unlocked function, state one, the key should be given an unlocking turn.

- These locks are non reversible and handing must be stated.
- These locks are for use with a 9mm SPLIT type spindle.
- These locks must NOT be used with thumb turn cylinders.
