

SPECIAL FUNCTION LOCK CASES

Twin cylinder upright mortice lock case, steel latch and deadbolts, heavy stainless steel radiused forend and strike plate, zinc plated steel body. Case pierced for bolt through furniture. Heavy sprung to suit unsprung lever handles.

FUNCTION:

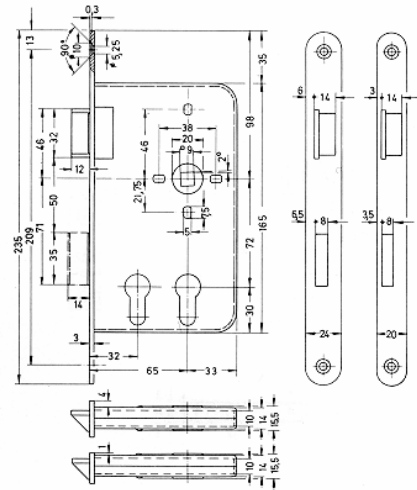

Latchbolt operated by lever furniture from one or both sides, additionally may be operated by a reverse turn of either of the two cylinders. Deadbolt thrown and withdrawn by either of the cylinders.

PURPOSE:

This lock can be used in situations where key control is required by two separate cylinder systems. Ideally suited to applications where both building users and Utility companies require access to plant rooms within a building. The building occupier may have their key as part of their own suiting system and the Utility can use the second cylinder as part of their system, the two users not requiring keys to the other's suite.

A second application for this lock case is for doors which must not have holes drilled right through the door, such as X-ray rooms, the lock can be operated by two half cylinders, each acting from one side of the door only.

This lock has a 9mm follower, care should be taken in selecting appropriate furniture types.
